Abstract

Write a concise abstract here. A typical research abstract briefly states the research question, data or setting, main method, main result, and contribution.

Keywords: keyword 1; keyword 2; keyword 3
JEL Codes: A10, C10

1 Introduction

Explain the research question, why it matters, what you do, what you find, and how the paper contributes to the literature.

A citation can look like Example (2020) or (Example, 2020).

2 Institutional Background or Model

Define the setting, model, institutions, or conceptual framework.

A generic specification can be written as

$$y_i = \alpha + \beta x_i + \gamma' z_i + \varepsilon_i, \qquad i = 1, \ldots, n. \tag{1}$$

Refer back to it as equation (1).

3 Data

Describe the data source, sample construction, key variables, and summary statistics.

4 Empirical Strategy

Explain the identifying variation and the assumptions required for interpretation. Keep the prose primary; equations should support the argument rather than replace it.

Table 1: Summary Statistics

Variable	Mean	Std. Dev.	Observations
Outcome	1.25	0.42	1,000
Treatment	0.48	0.50	1,000
Control variable	2.10	1.13	1,000

Notes: This table reports summary statistics for the analysis sample.

Assumption 1. *State an assumption clearly and in words that a reader can interpret.*

5 Results

Present the main findings. Refer to tables and figures automatically, for example table 1.

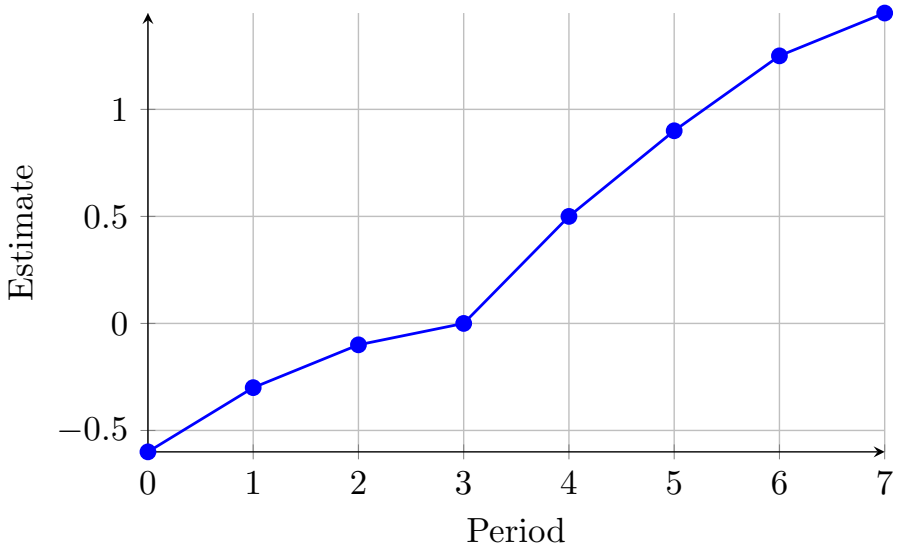

Figure 1: Main Result

Notes: Explain what is plotted, the sample, uncertainty intervals, and any important construction details.

6 Robustness and Extensions

Organize robustness checks by the threat or concern they address, rather than listing specifications mechanically.

7 Conclusion

Summarize the main result and contribution without simply repeating the introduction.

References

Example, A. (2020). Example paper title. *Journal Name*, 1(1):1–20.

A Additional Results

Put additional derivations, tables, figures, proofs, variable definitions, or robustness results here.
